

Last Class: Semaphores

- A semaphore S supports two atomic operations:
 - $S \rightarrow \text{Wait}()$: get a semaphore, wait if busy semaphore S is available.
 - $S \rightarrow \text{Signal}()$: release the semaphore, wake up a process if one is waiting for S .
- **Binary or Mutex Semaphore**: grants mutual exclusive access to a resource
- **Counting Semaphore**: useful for granting mutually exclusive access for a set of resources
- Semaphores are useful for mutual exclusion, progress and bounded waiting

Today: Synchronization for Readers/Writers Problem

- An object is shared among many threads, each belonging to one of two classes:
 - Readers: read data, never modify it
 - Writers: read data and modify it
- Using a single lock on the data object is overly restrictive
 - ⇒ Want *many readers* reading the object at once
 - Allow only *one writer* at any point
 - How do we control access to the object to permit this protocol?
- Correctness criteria:
 - Each read or write of the shared data must happen within a critical section.
 - Guarantee mutual exclusion for writers.
 - Allow multiple readers to execute in the critical section at once.

```

ReadWriter::Write() {
    wrt->Wait(); // any writers or readers?
    <perform write>
    wrt->Signal(); // enable others
}
ReadWriter::Read() {
    mutex->Wait(); // ensure mutual exclusion
    readers += 1; // another reader
    if (readers == 1)
        wrt->Wait(); // block writers
    mutex->Signal();
    <perform read>
    mutex->Wait(); // ensure mutual exclusion
    readers -= 1; // reader done
    wrt->Signal(); // enable writers
}

```

Readers/Writers Problem

```

class ReadWrite {
public:
    void Read();
    void Write();
private:
    int readers; // counts readers
    Semaphore mutex; // controls access to readers
    Semaphore wrt; // controls entry to first
                    // writer or reader
    ReadWriter::ReadWrite {
        readers = 0;
        mutex->value = 1;
        wrt->value = 1;
    }
}

```

Readers/Writers Problem

Reader/Writers: Scenario 3

```

R1:
Read ()

R2:
Write ()

W1:
Write ()

Read ()

```

Readers/Writers Solution: Discussion

- Implementation notes:
 1. The first reader blocks if there is a writer; any other readers who try to enter block on mutex.
 2. The last reader to exit signals a waiting writer.
 3. When a writer exits, if there is both a reader and writer waiting, which goes next depends on the scheduler.
 4. If a writer exits and a reader goes next, then all readers that are waiting will fall through (at least one is waiting on wrt and zero or more can be waiting on mutex).
 5. Does this solution guarantee all threads will make progress?
- Alternative desirable semantics:
 - Let a writer enter its critical section as soon as possible.

```

ReadWrite::Read() {
    write_pending->Wait(); // ensures at most one reader will go
                          // before a pending write
    read_block->Wait();
    read_mutex->Wait(); // ensure mutual exclusion
                        // another reader
                        // if (readers == 1) // synchronize with writers
                        write_block->Wait();
    read_mutex->Signal();
    read_block->Signal();
    write_pending->Signal();
    <perform read
    read_mutex->Wait(); // ensure mutual exclusion
                        // reader done
                        // readers == 1;
                        // enable writers
    write_block->Signal();
    read_mutex->Signal(); }

```

Readers/Writers Solution Favoring Writers

```

ReadWrite::Write() {
    write_mutex->Wait(); // ensure mutual exclusion
                        // another pending writer
                        // if (writers == 1) // block readers
                        read_block->Wait();
    write_mutex->Signal();
    write_block->Wait(); // ensure mutual exclusion
                        <perform write
    write_block->Signal();
    write_mutex->Wait(); // ensure mutual exclusion
                        // writer done
                        // if (writers == 0) // enable readers
    read_block->Signal();
    write_mutex->Signal(); }

```

Readers/Writers Solution Favoring Writers

R1: Read ()
 R2: Read ()
 W1: Write ()
 W2: Write ()

Readers/Writers: Scenario 5

R1: Read ()
 R2: Read ()
 W1: Write ()
 W2: Write ()

Readers/Writers: Scenario 4

- Five philosophers, each either eats or thinks
- Share a circular table with five chopsticks
- Thinking: do nothing
- Eating \Rightarrow need two chopsticks, try to pick up two closest chopsticks
 - Block if neighbor has already picked up a chopstick
- After eating, put down both chopsticks and go back to thinking

Other Synchronizations Problems: Dining Philosophers

R1: Read ()
 R2: Read ()
 W1: Write ()
 W2: Write ()

Reader/Writers: Scenario 6

Summary

- Readers/writers problem:
 - Allow multiple readers to concurrently access a data
 - Allow only one writer at a time
- Two possible solutions using semaphores
 - Favor readers
 - Favor writers
- Starvation is possible in either case!
