Today: Distributed File Systems

- Issues in distributed file systems
- Sun's Network File System case study

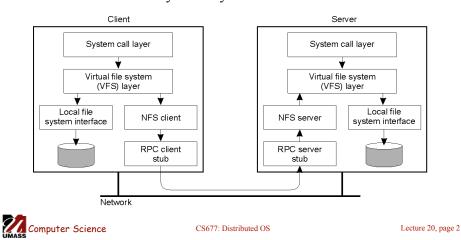

CS677: Distributed OS

Lecture 20, page 1

NFS Architecture

- Sun's Network File System (NFS) widely used distributed file system
- Uses the virtual file system layer to handle local and remote files

NFS Operations

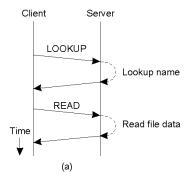

Operation	v3	v4	Description	
Create	Yes	No	Create a regular file	
Create	No	Yes	Create a nonregular file	
Link	Yes	Yes	Create a hard link to a file	
Symlink	Yes	No	Create a symbolic link to a file	
Mkdir	Yes	No	Create a subdirectory in a given directory	
Mknod	Yes	No	Create a special file	
Rename	Yes	Yes	Change the name of a file	
Rmdir	Yes	No	Remove an empty subdirectory from a directory	
Open	No	Yes	Open a file	
Close	No	Yes	Close a file	
Lookup	Yes	Yes	Look up a file by means of a file name	
Readdir	Yes	Yes	Read the entries in a directory	
Readlink	Yes	Yes	Read the path name stored in a symbolic link	
Getattr	Yes	Yes	Read the attribute values for a file	
Setattr	Yes	Yes	Set one or more attribute values for a file	
Read	Yes	Yes	Read the data contained in a file	
Write	Yes	Yes	Write data to a file	

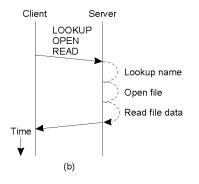

CS677: Distributed OS

Lecture 20, page 3

Communication

- a) Reading data from a file in NFS version 3.
- b) Reading data using a compound procedure in version 4.

Both versions use Open Network Computing (ONC) RPCs

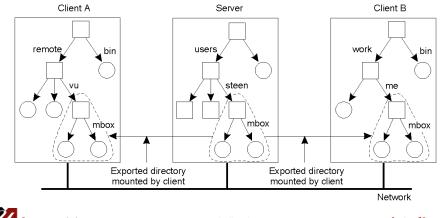

- One RPC per operation (NFS v3); multiple operations supported in v4.

CS677: Distributed OS

Naming: Mount Protocol

- NFS uses the mount protocol to access remote files
 - Mount protocol establishes a local name for remote files
 - Users access remote files using local names; OS takes care of the mapping

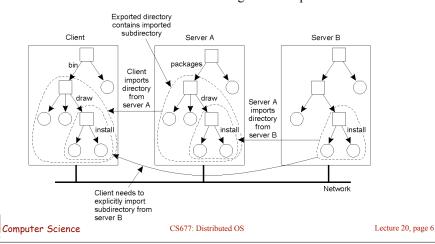

Computer Science

CS677: Distributed OS

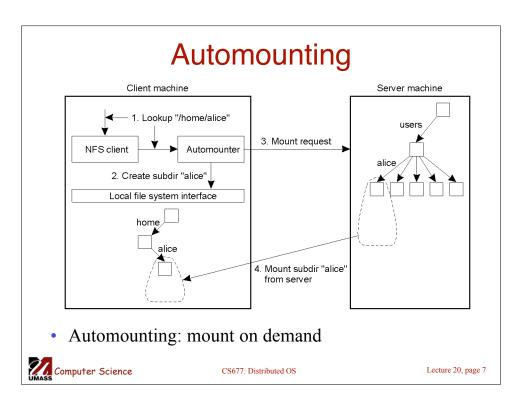

Lecture 20, page 5

Naming: Crossing Mount Points

- Mounting nested directories from multiple servers
- NFS v3 does not support transitive exports (for security reasons)
 - NFS v4 allows clients to detects crossing of mount points

3

File Attributes (1)

Attribute	Description
TYPE	The type of the file (regular, directory, symbolic link)
SIZE	The length of the file in bytes
CHANGE	Indicator for a client to see if and/or when the file has changed
FSID	Server-unique identifier of the file's file system

- Some general mandatory file attributes in NFS.
 - NFS modeled based on Unix-like file systems
 - Implementing NFS on other file systems (Windows) difficult
 - NFS v4 enhances compatibility by using mandatory and recommended attributes

CS677: Distributed OS

File Attributes (2)

Attribute	Description		
ACL	an access control list associated with the file		
FILEHANDLE	The server-provided file handle of this file		
FILEID	A file-system unique identifier for this file		
FS_LOCATIONS	Locations in the network where this file system may be found		
OWNER	The character-string name of the file's owner		
TIME_ACCESS	Time when the file data were last accessed		
TIME_MODIFY	Time when the file data were last modified		
TIME_CREATE	Time when the file was created		

• Some general recommended file attributes.

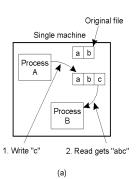

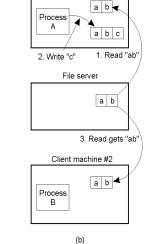

CS677: Distributed OS

Lecture 20, page 9

Semantics of File Sharing

- a) On a single processor, when a *read* follows a *write*, the value returned by the *read* is the value just written.
- b) In a distributed system with caching, obsolete values may be returned.

Client machine #1

Computer Science

5

Semantics of File Sharing

Method	Comment
UNIX semantics	Every operation on a file is instantly visible to all processes
Session semantics	No changes are visible to other processes until the file is closed
Immutable files	No updates are possible; simplifies sharing and replication
Transaction	All changes occur atomically

- Four ways of dealing with the shared files in a distributed system.
 - NFS implements session semantics
 - Can use remote/access model for providing UNIX semantics (expensive)
 - Most implementations use local caches for performance and provide session semantics

CS677: Distributed OS

Lecture 20, page 11

File Locking in NFS

Operation	Description	
Lock	Creates a lock for a range of bytes (non-blocking_	
Lockt	Test whether a conflicting lock has been granted	
Locku	Remove a lock from a range of bytes	
Renew	Renew the lease on a specified lock	

- NFS supports file locking
 - Applications can use locks to ensure consistency
 - Locking was not part of NFS until version 3
 - NFS v4 supports locking as part of the protocol (see above table)

CS677: Distributed OS

File Locking: Share Reservations

Current file denial state

Request access

	NONE	READ	WRITE	вотн
READ	Succeed	Fail	Succeed	Fail
WRITE	Succeed	Succeed	Fail	Fail
вотн	Succeed	Fail	Fail	Fail
(a)	•		•	•

Requested file denial state

Current access state

	NONE	READ	WRITE	вотн
READ	Succeed	Fail	Succeed	Fail
WRITE	Succeed	Succeed	Fail	Fail
вотн	Succeed	Fail	Fail	Fail

(b)

- The result of an *open* operation with share reservations in NFS.
- a) When the client requests shared access given the current denial state.
- b) When the client requests a denial state given the current file access state.

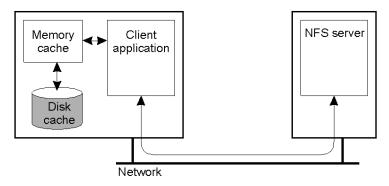

CS677: Distributed OS

Lecture 20, page 13

Client Caching

- Client-side caching is left to the implementation (NFS does not prohibit it)
 - Different implementation use different caching policies
 - Sun: allow cache data to be stale for up to 30 seconds

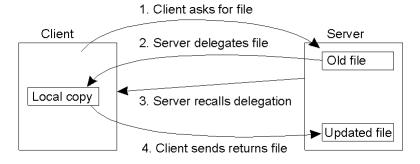

Computer Science

CS677: Distributed OS

Client Caching: Delegation

- NFS V4 supports open delegation
 - Server delegates local open and close requests to the NFS client
 - Uses a callback mechanism to recall file delegation.

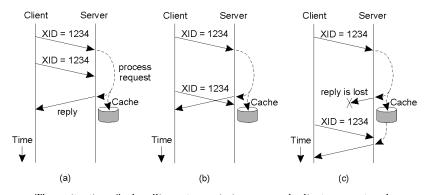

Computer Science

CS677: Distributed OS

Lecture 20, page 15

RPC Failures

- Three situations for handling retransmissions: use a duplicate request cache
- a) The request is still in progress
- b) The reply has just been returned
- c) The reply has been some time ago, but was lost.

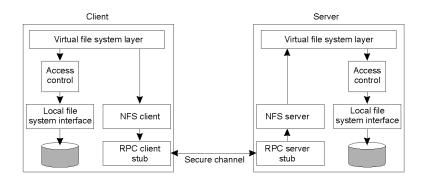

Use a duplicate-request cache: transaction Ids on RPCs, results cached

CS677: Distributed OS

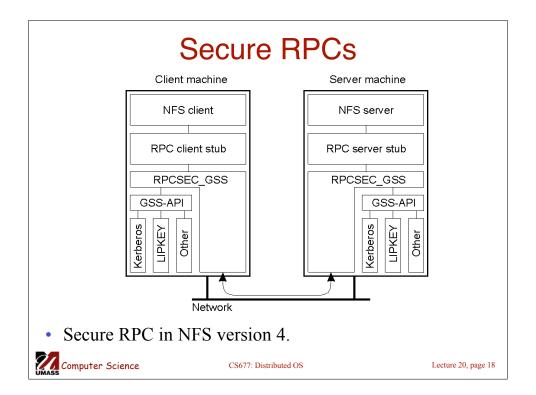

Security

- The NFS security architecture.
 - Simplest case: user ID, group ID authentication only

CS677: Distributed OS

Replica Servers

- NFS ver 4 supports replications
- Entire file systems must be replicated
- FS_LOCATION attribute for each file
- Replicated servers: implementation specific

CS677: Distributed OS
