Last Class: RPCs and RMI

- Case Study: Sun RPC
- Lightweight RPCs
- Remote Method Invocation (RMI)
 - Design issues

CS677: Distributed OS

Lecture 10, page 1

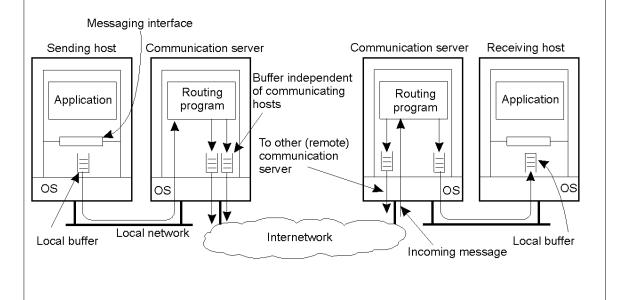

Today: Communication Issues

- Message-oriented communication
 - Persistence and synchronicity
- Stream-oriented communication

CS677: Distributed OS

Persistence and Synchronicity in Communication

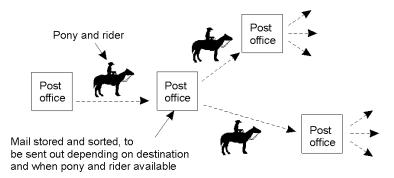

Persistence

CS677: Distributed OS

Persistent communication

Computer Science

- Messages are stored until (next) receiver is ready
- Examples: email, pony express

CS677: Distributed OS

Lecture 10, page 4

Transient Communication

- Transient communication
 - Message is stored only so long as sending/receiving application are executing
 - Discard message if it can't be delivered to next server/receiver
 - Example: transport-level communication services offer transient communication
 - Example: Typical network router discard message if it can't be delivered next router or destination

CS677: Distributed OS

Lecture 10, page 5

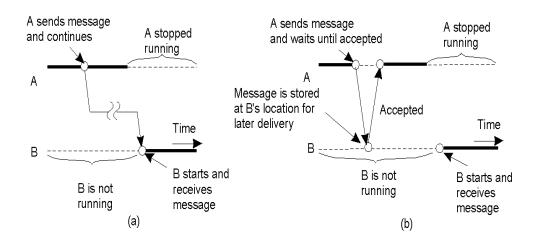

Synchronicity

- Asynchronous communication
 - Sender continues immediately after it has submitted the message
 - Need a local buffer at the sending host
- Synchronous communication
 - Sender blocks until message is stored in a local buffer at the receiving host or actually delivered to sending
 - Variant: block until receiver processes the message
- Six combinations of persistence and synchronicity

CS677: Distributed OS

Persistence and Synchronicity Combinations

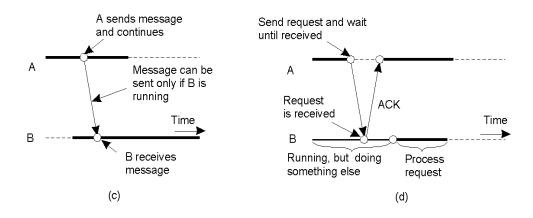

- a) Persistent asynchronous communication (e.g., email)
- b) Persistent synchronous communication

CS677: Distributed OS

Lecture 10, page 7

Persistence and Synchronicity Combinations

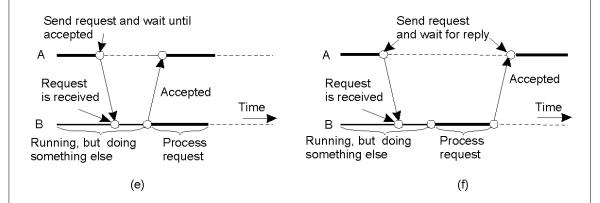

- c) Transient asynchronous communication (e.g., UDP)
- d) Receipt-based transient synchronous communication

CS677: Distributed OS

Persistence and Synchronicity Combinations

- e) Delivery-based transient synchronous communication at message delivery (e.g., asynchronous RPC)
- f) Response-based transient synchronous communication (RPC)

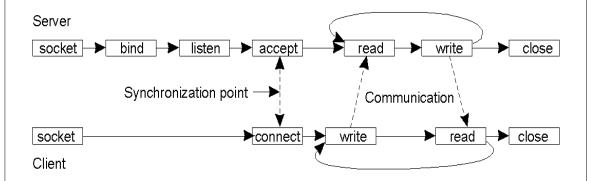

CS677: Distributed OS

Lecture 10, page 9

Message-oriented Transient Communication

- Many distributed systems built on top of simple message-oriented model
 - Example: Berkeley sockets

CS677: Distributed OS

Berkeley Socket Primitives

Primitive	Meaning	
Socket	Create a new communication endpoint	
Bind	Attach a local address to a socket	
Listen	Announce willingness to accept connections	
Accept	Block caller until a connection request arrives	
Connect	Actively attempt to establish a connection	
Send	Send some data over the connection	
Receive	Receive some data over the connection	
Close	Release the connection	

CS677: Distributed OS

Lecture 10, page 11

Message-Passing Interface (MPI)

- Sockets designed for network communication (e.g., TCP/IP)
 - Support simple send/receive primitives
- Abstraction not suitable for other protocols in clusters of workstations or massively parallel systems
 - Need an interface with more advanced primitives
- Large number of incompatible proprietary libraries and protocols
 - Need for a standard interface
- Message-passing interface (MPI)
 - Hardware independent
 - Designed for parallel applications (uses transient communication)
- Key idea: communication between groups of processes
 - Each endpoint is a (groupID, processID) pair

CS677: Distributed OS

MPI Primitives

Primitive	Meaning
MPI_bsend	Append outgoing message to a local send buffer
MPI_send	Send a message and wait until copied to local or remote buffer
MPI_ssend	Send a message and wait until receipt starts
MPI_sendrecv	Send a message and wait for reply
MPI_isend	Pass reference to outgoing message, and continue
MPI_issend	Pass reference to outgoing message, and wait until receipt starts
MPI_recv	Receive a message; block if there are none
MPI_irecv	Check if there is an incoming message, but do not block

CS677: Distributed OS

Lecture 10, page 13

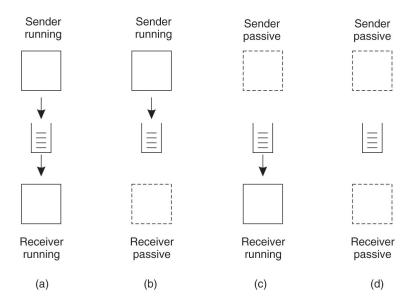

Message-oriented Persistent Communication

- Message queuing systems
 - Support asynchronous persistent communication
 - Intermediate storage for message while sender/receiver are inactive
 - Example application: email
- Communicate by inserting messages in queues
- Sender is only guaranteed that message will be eventually inserted in recipient's queue
 - No guarantees on when or if the message will be read
 - "Loosely coupled communication"

CS677: Distributed OS

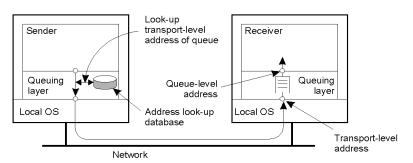

Message-Queuing Model (1)

Lecture 10, page 15

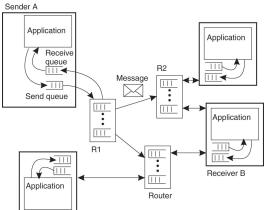

Message-Queuing Model

Primitive	Meaning
Put	Append a message to a specified queue
Get	Block until the specified queue is nonempty, and remove the first message
Poll	Check a specified queue for messages, and remove the first. Never block.
Notify	Install a handler to be called when a message is put into the specified queue.

General Architecture of a Message-Queuing System (2)

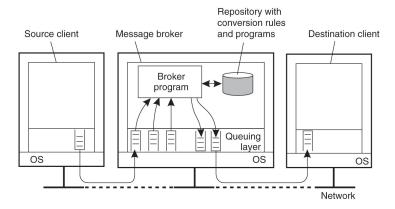

- Queue manager and relays
 - Relays use an overlay network
 - Relays know about the network topology and how to route

Lecture 10, page 17

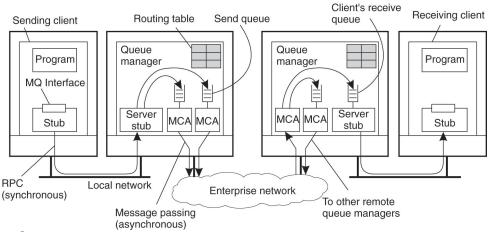

Message Brokers

- Message broker: application level gateway in MQS
 - Convert incoming messages so that they can be understood by destination (format conversion)
 - Also used for pub-sub systems

IBM's WebSphere MQ

- Queue managers manage queues
 - Connected through message channels
- Message channel agent (MCA)
 - Checks queue, wraps into TCP packet, send to receiving MCA

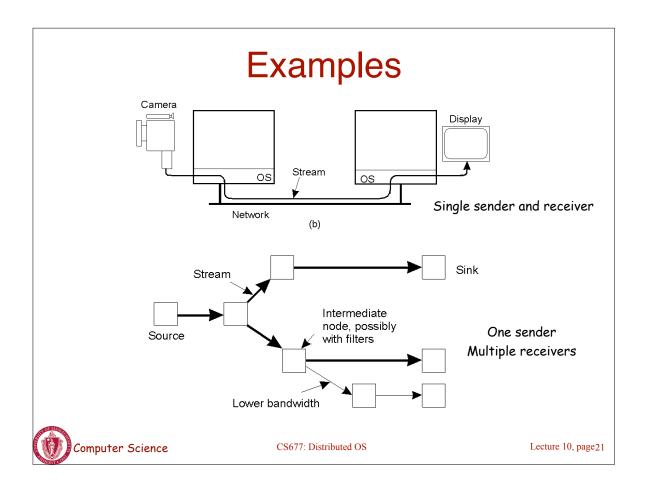

Lecture 10, page 19

Stream Oriented Communication

- Message-oriented communication: request-response
 - When communication occurs and speed do not affect correctness
- Timing is crucial in certain forms of communication
 - Examples: audio and video ("continuous media")
 - 30 frames/s video => receive and display a frame every 33ms
- Characteristics
 - Isochronous communication
 - Data transfers have a maximum bound on end-end delay and jitter
 - Push mode: no explicit requests for individual data units beyond the first "play" request

CS677: Distributed OS

Streams and Quality of Service

- Properties for Quality of Service:
- The required bit rate at which data should be transported.
- The maximum delay until a session has been set up
- The maximum end-to-end delay.
- The maximum delay variance, or jitter.
- The maximum round-trip delay.

Quality of Service (QoS)

- Time-dependent and other requirements are specified as *quality of service (QoS)*
 - Requirements/desired guarantees from the underlying systems
 - Application specifies workload and requests a certain service quality
 - Contract between the application and the system

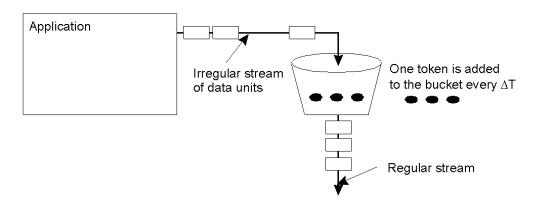

Characteristics of the Input	Service Required
 maximum data unit size (bytes) Token bucket rate (bytes/sec) Toke bucket size (bytes) Maximum transmission rate (bytes/sec) 	 Loss sensitivity (bytes) Loss interval (μsec) Burst loss sensitivity (data units) Minimum delay noticed (μsec) Maximum delay variation (μsec) Quality of guarantee

CS677: Distributed OS

Lecture 10, page23

Specifying QoS: Token bucket

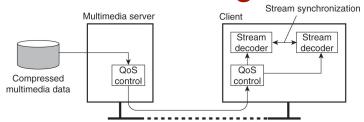

- The principle of a token bucket algorithm
 - Parameters (rate r, burst b)
 - Rate is the average rate, burst is the maximum number of packets that can arrive simultaneously

CS677: Distributed OS

Enforcing QoS

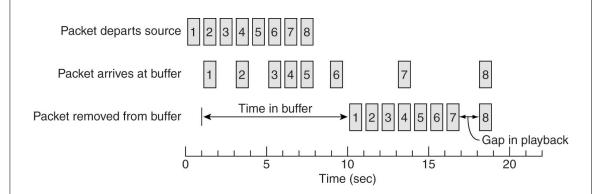

- Entorce at end-points (e.g., token bucket)
 - No network support needed
- Mark packets and use router support
 - Differentiated services: expedited & assured forwarding
- Use buffers at receiver to mask jitter
- Packet losses
 - Handle using forward error correction
 - Use interleaving to reduce impact

CS677: Distributed OS

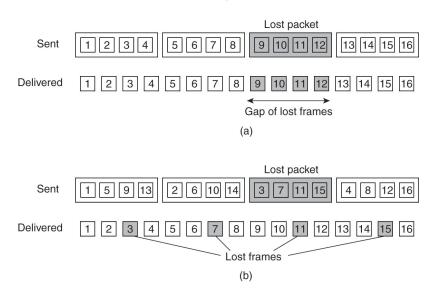

Lecture 10, page 25

Enforcing QoS (1)

Enforcing QoS (2)

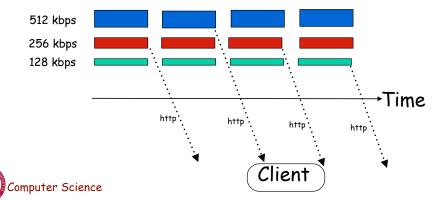

Can also use forward error correction (FEC)

Lecture 10, page 27

HTTP Streaming

- UDP is inherently better suited for streaming
 - Adaptive streaming, specialized streaming protocols
- Yet, almost all streaming occurs over HTTP (and TCP)
 - Universal availability of HTTP, no special protocol needed
- Direct Adaptive Streaming over HTTP (DASH)
 - Intelligence is placed at the client

Stream synchronization

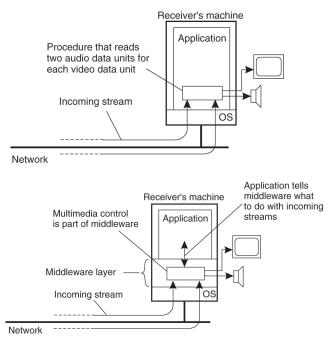

- Multiple streams:
 - Audio and video; layered video
- Need to sync prior to playback
 - Timestamp each stream and sync up data units prior to playback
- Sender or receiver?
- App does low-level sync
 - 30 fps: image every 33ms, lip-sync with audio
- Use middleware and specify playback rates

CS677: Distributed OS

Lecture 10, page 29

Synchronization Mechanism

Multicasting

- Group communication
 - IP multicast versus application-level multicast
 - Construct an overlay multicast tree rooted at the sender
 - Send packet down each link in the tree
- Issues: tree construction, dynamic joins and leaves

CS677: Distributed OS

Lecture 10, page 31

Overlay Construction
