Distributed Pervasive Systems

- Distributed Pervasive Systems
- Sensor Networks
- Energy in Distributed Systems (Green Computing)
- Course wrapup

CS677: Distributed

Lecture 26, page 1

Pervasive Computing

- Computing become pervasive or ubiquitous
- Rise of "devices"
- Computing everywhere
 - smart cities, smart homes, smart highways, smart classroom, ...

Rise of Pervasive Computing

- Internet of things
 - ability to network devices and have them communicate
- Sensor networks
 - Large networks of sensors
- Driven by miniaturization of computing
 - Tiny sensors with computing and communication capability

Lecture 26, page 3

Example Applications

Smart home

Personal Health Monitoring

Sensors to monitor fitness, diabetes, blood pressure, detect falls

Google tests prototype of diabetestracking 'smart' contact lens

Lecture 25, page 5

Typical Smart Apps

- Personal device to mobile phone to the cloud
 - Upload data to cloud via a mobile device (or directly)
 - Low-power communication to phone
 - Cloud provides analytics and provides feedback to phone
- Environmental sensors to internet to the cloud
 - Internet-enabled sensors
 - direct upload to servers / cloud
 - Cloud provides analytics and provides dashboard

Sensor Platform

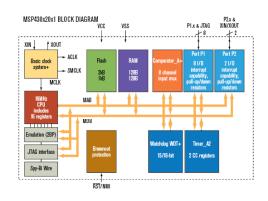

- Smart devices are a sensor node
- Resource-constrained distributed system
- Typical Sensor platform
 - Low-power radios for communication
 - 10-200kbit/sec
 - Small CPUs
 - E.g. 8bit, 4k RAM.
 - Flash storage
 - Sensors
 - Battery driven or self-powered

Lecture 26, page 7

Small CPUs

- Example: Atmel AVR
 - 8 bit
 - 4 KB RAM
 - 128 KB code flash
 - ~2 MIPS @ 8MHz
 - $\sim 8 \text{ mA}$
- Example: TI MSP430
 - 16 bit (sort of)
 - 10 KB RAM
 - 48 KB code flash
 - 2 mA

Higher-powered processors:
ARM7 (Yale XYZ platform)
32 bit, 50 MHz, >>1MB RAM
ARM9 (StarGate, others)
32 bit, 400 MHz, >>16MB RAM

Low Power Radios

- ISM band 430, 900, or 2400 MHz
- Varying modulation and protocol:
 - Custom (FSK?) Mica2, 20 kbit/s
 - Bluetooth
 - Zigbee (802.15.4) ~200kbit/sec
- Short range
 - Typically <100 meters
- Low power. E.g. Chipcon CC2420:
 - 9-17 mA transmit (depending on output level)
 - 19 mA receive
- Listening can take more energy than transmitting

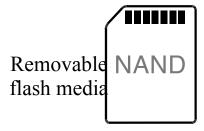

Lecture 26, page 9

Flash Storage

- Raw flash
- Small (serial NOR), very low power (NAND)
- Page-at-a-time write
- No overwrite without erasing
- Divided into pages and erase blocks
- Typical values: 512B pages,
 32 pages in erase block
- Garbage collection needed to gather free pages for erasing

Disk-like interface
512B re-writable blocks
Very convenient
Higher power consumption

"Cooked" flash

Battery Power

Example: Mica2 "mote"

• Total battery capacity: 2500mAH (2 AA cells)

• System consumption: 25 mA (CPU and radio on)

• Lifetime: 100 hours (4 days)

•

• Alternatives:

Bigger batteries

Solar/wind/... ("energy harvesting")

Duty cycling

Sensors

- Temperature
- Humidity
- Magnetometer
- Vibration
- Acoustic
- Light
- Motion (e.g. passive IR)
- Imaging (cameras)
- Ultrasonic ranging
- GPS
- Lots of others...

Self-harvesting Sensors

- Harvest energy from environment to power themselves
 - tiny solar panels, use vibration, airflow, or wireless energy

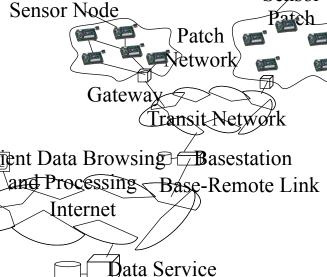

Lecture 26, page 13

Sensor

Typical Design Issues

- Single node
 - Battery power or how to harvest energy to maximize lifetime
- Inside a network of sensors
 - Data aggregation
 - Duty cycling
 - Localization, Synchronization Client Data Browsing Basestation
 - Routing
- Once data is brought out of the network (server-side processing)
 - "Big data" analytics
 - Derive insights

Green Computing

- Greening of computing
 - Sustainable IT
 - How to design energy-efficient hardware, software and systems?
- Computing for Greening
 - Use of IT to make physical infrastructure efficient?
 - · Homes, offices, buildings, transportation

Lecture 26, page 15

Some History

- Energy-efficient mobile devices a long standing problem
 - Motivation: better battery life, not green
- Recent growth of data centers
 - More energy-efficient server design
 - Motivation: lower electricity bills
 - · Green systems, lower carbon footprint
- Apply "Greening" to other systems
 - IT for Greening

Computing and Power Consumption

- Energy to Compute
 - 20% power usage in office buildings
 - 50%-80% at a large college
 - 3% of our carbon footprint and growing
- Data centers are a large fraction of the IT carbon footprint
 - PCs, mobile devices also a significant part

Lecture 26, page 17

What is a data center?

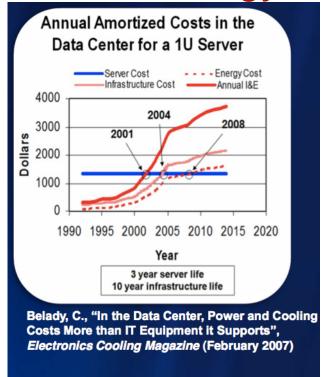

- Facility for housing a large number of servers and data storage
- Google data center (Dalles, OR)
 - 12 football fields in size
 - Compare to box stores!
 - 100 MW of power
 - Enough for a small city
 - ~ 100 K servers

Data Center Energy Costs

Lecture 26, page 19

Energy Bill of a Google Data center

- Assume 100,000 servers
- Monthly cost of 1 server
 - 500W server
 - Cost=(Watts X Hours / 1000) * cost per KWH
 - Always-on server monthly cost = \$50
- Monthly bill for 100K servers = \$5M
- What about cost of cooling?
 - Use PUE (power usage efficiency)
 - PUE =2 => cost doubles
 - Google PUE of 1.2 => 20% extra on 5M (\sim \$6M)

Class exercises

- Calculate the energy cost and carbon footprint of
 - A laptop
 - A desktop
 - Always-on machine
 - A machine that is switched off in the night

Lecture 26, page 21

How to design green data centers?

- A green data center will
 - Reduce the cost of running servers
 - Cut cooling costs
 - Employ green best practices for infrastructure

Reducing server energy cost

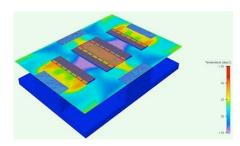

- Buy / design energy-efficient servers
 - Better hardware, better power supplies
 - DC is more energy-efficient than AC
- Manage your servers better!
 - Intelligent power management
 - Turn off servers when not in use
 - Virtualization => can move apps around

Lecture 26, page 23

Reducing cooling costs

- Better air conditioning
 - Thermal engineering / better airflow
 - Move work to cooler regions
- Newer cooling
 - Naturally cooled data ctrs
 - Underground bunkers

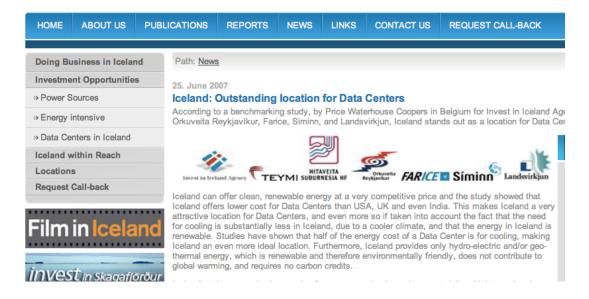

Build them in Iceland

Invest in Iceland Agency

Lecture 26, page 25

Desktop Power management

- Large companies => 50K desktops or more
 - Always on: no one switches them off at night
 - Night IT tasks: backups, patches etc
- Better desktop power management
 - Automatic sleep policies
 - Automatic / easy wakeups [see Usenix 2010]

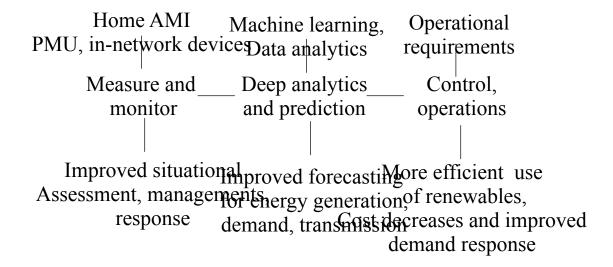

IT for Greening

- How can we use IT to make buildings green?
 - Use sensors, smart software, smart appliances, smart meters
- Building as an example of a distributed system
 - Sensors monitor energy, occupancy, temperature etc
 - Analyze data
 - Exercise control
 - switch of lights or turn down heat in unoccupied zones
 - Use renewables to reduce carbon footprint

Lecture 26, page 27

Approach

Potential Solution

- Monitor and profile usage
 - Power supply/demand profile
- Increase Efficiency
 - Turn on/off systems automatically
 - Consolidate computers
 - Tune various subsystems
- Use Alternative Energy Sources
 - Tune systems to variable energy supplies

Lecture 26, page 29

Outlet level Building Monitoring

- Designed sensors for power outlet monitoring
 - Based on the Kill-A-Watt design
- Modified sensor with low-power wireless radio
 - Transmits data to strategically placed receivers
 - Use plug computers for receivers

Fine-grained Building Monitoring

- Advantages
 - Accurate, fine-grain data
 - Cheap money-wise to build
 - Able to put them everywhere
 - Good experience for undergraduates

Expensive time-wise to build

Lecture 26, page 31

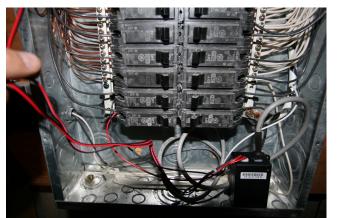

Meter level Monitoring

 Install on main panel IED 5000-G

Analyzing the data

- Energy monitors / sensors provide real-time usage data
 - Smart meters:
 - Building monitoring systems (BMS) data from office / comme buildings
- Modeling, Analytics and Prediction
 - Use statistical techniques, machine learning and modeling to gain insights
 - Which homes have inefficient furnaces, heaters, dryers? Are you wasting energy in your home?
 - Is an office building's AC schedule aligned with occupancy patterns?
 - When will the aggregate load or transmission load peak?

Lecture 26, page 33

Deployments in Western MA

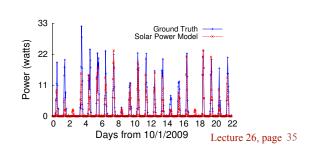

Use Renewables

- Rooftop Solar, Solar Thermal (to heat water)
- Design predictive analytics to model and forecast energy generation from renewables
 - Use machine learning and NWS weather forecasts to predict solar and wind generation
- Benefits: Better forecasts of near-term generation; "Sunny load" scheduling

People: Feedback and Incentives

- How to exploit big data to motivate consumers to be more energy efficient?
 - What incentives work across different demographics?
 - Deployments + user studies
- Big data methods can reveal insights into usage patterns, waste, efficiency opportunities
 - Smart phone as an engagement tool to deliver big data insights to end-users
 - Provide highly personalized recommendations, solicit user inputs, motivate users

Summary

- Greening of computing
 - Design of energy-efficient hardware & software
- Computing for greening
 - Use of IT for monitoring
 - Use of intelligent software for power management
 - Forecasting for renewable energy harvesting

Lecture 26, page 37
