Distributed and Operating Systems Spring 2022

Prashant Shenoy

UMass CICS

http://lass.cs.umass.edu/~shenoy/courses/677

UMassAmherst CS677: Distributed OS Lecture 1, page 1

Course Syllabus

- COMPSCI 677: Distributed and Operating Systems
- Course web page: http://lass.cs.umass.edu/~shenoy/courses/677
 - Syllabus posted on the course web page.
- Class has two sections
 - Section 1 (classroom section)
 - Section 2 (online section)
 - Both sections do the same work (exams, lab, homework, etc)

Course Staff

• *Instructor:* Prashant Shenoy

- Email: shenoy@cs.umass.edu, Phone: (413) 577 0850

- Office hours: W: 3:45-4:45 LGRC A333 (Initially held over zoom)

Teaching Assistants

Bin Wang

Chris Nota

Jorge Murillo

Hao Shi

TA Office Hours: TBD

• Course/Grading Assistants

UMassAmherst

Noel Varghese

Akshay Raju Lecture 1, page 3

Course Textbook

- *Textbook:* No textbook; will use notes and readings
- Suggested references (not mandatory)
- Distributed Systems, 3rd ed, by Tannenbaum and Van Steen, Prentice Hall 2017
 - PDF version of textbook is available for free from authors
 - Download your PDF copy from:

https://www.distributed-systems.net/index.php/books/distributed-systems-3rd-edition-2017/

- Print copy: Hardcopy available from Amazon Textbook store
- Older 2nd Edition is also available as a PDF:
 - https://www.distributed-systems.net/index.php/books/distributed-systems/

UMassAmherst Lecture 1, page 4

Course Outline

- Introduction (today)
 - What, why, why not?
 - Basics
- Distributed Architectures
- Interprocess Communication
 - RPCs, RMI, message- and stream-oriented communication
- Processes and their scheduling
 - Thread/process scheduling, code/process migration, virtualization
- Naming and location management
 - Entities, addresses, access points

UMassAmherst CS677: Distributed OS Lecture 1, page 5

Course Outline

- Canonical problems and solutions
 - Mutual exclusion, leader election, clock synchronization, ...
- Resource sharing, replication and consistency
 - DFS, consistency issues, caching and replication
- Fault-tolerance
- Security in distributed Systems
- Distributed middleware
- Advanced topics: web, cloud computing, green computing, big data, multimedia, and mobile systems

Course Grading

- Grading
 - Homeworks (8%), 3-4 programming assignments (50%),
 - 1 mid-term and 1 final exam (40%) [Midterm: March 25]
 - class participation+quizzes+online discussions: 2%
- Pre-requisites
 - Undergrad course in operating systems
 - Good programming skills in a high-level prog. language

UMassAmherst CS677: Distributed OS Lecture 1, page 7

Course Tools

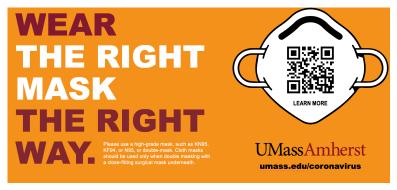

- *Piazza*: online discussion forum. Register at:
 - <u>https://piazza.com/umass/spring2022/compsci677</u>
- *Gradescope*: Used for written assignments (homework and quizzes)
- Github Classroom: Used for programming assignments
- Web page: https://lass.cs.umass.edu/~shenoy/courses/677
- Youtube Channel: https://youtube.com/umassos
- Moodle: Mostly used as an online grade book

UMassAmherst Lecture 1, page 8

Course Policies

Class Participation: Need a scribe for each class

Mask Policy:

• Device Policy:

UMassAmherst Lecture 1, page 9

Module 2: Why Distributed Systems?

- Many systems that we use on a daily basis are distributed
 - World wide web, Google
 - Cloud computing
 - Amazon.com
 - Peer-to-peer file sharing systems
 - SETI@Home
 - Grid and cluster computing
 - Modern networked computers
- Useful to understand how such real-world systems work
- Course covers basic principles for designing distributed systems

Definition of a Distributed System

- A distributed system:
 - Multiple connected CPUs working together
 - A collection of independent computers that appears to its users as a single coherent system
- Examples: parallel machines, networked machines

UMassAmherst Lecture 1, page 11

Advantages and Disadvantages

- Advantages
 - Communication and resource sharing possible
 - Economics price-performance ratio
 - Reliability, scalability
 - Potential for incremental growth
- Disadvantages
 - Distribution-aware PLs, OSs and applications
 - Network connectivity essential
 - Security and privacy

Transparency in a Distributed System

Transparency	Description	
Access	Hide differences in data representation and how a resource is accessed	
Location	Hide where a resource is located	
Migration	Hide that a resource may move to another location	
Relocation	Hide that a resource may be moved to another location while in use	
Replication	Hide that a resource may be replicated	
Concurrency	Hide that a resource may be shared by several competitive users	
Failure	Hide the failure and recovery of a resource	
Persistence	Hide whether a (software) resource is in memory or on disk	

Different forms of transparency in a distributed system.

UMassAmherst CS677: Distributed OS Lecture 1, page 13

Open Distributed Systems

- Offer services that are described a priori
 - Syntax and semantics are known via protocols
- Services specified via interfaces
- Benefits
 - Interoperability
 - Portability
- Extensibility
 - Open system evolve over time and should be extensible to accommodate new functionality.
 - Separate policy from mechanism

Scalability Problems

Concept	Example		
Centralized services	A single server for all users		
Centralized data	A single on-line telephone book		
Centralized algorithms	Doing routing based on complete information		

Examples of scalability limitations.

UMassAmherst CS677: Distributed OS Lecture 1, page 15

Scaling Techniques

- Principles for good decentralized algorithms
 - No machine has complete state
 - Make decision based on local information
 - A single failure does not bring down the system
 - No global clock
- Techniques
 - Asynchronous communication
 - Distribution
 - Caching and replication

Module 3: Distributed Systems History and OS Models

- Minicomputer model (e.g., early networks)
 - Each user has local machine
 - Local processing but can fetch remote data (files, databases)
- Workstation model (e.g., Sprite)
 - Processing can also migrate
- Client-server Model (e.g., V system, world wide web)
 - User has local workstation
 - Powerful workstations serve as servers (file, print, DB servers)
- Processor pool model (e.g., Amoeba, Plan 9)
 - Terminals are Xterms or diskless terminals
 - Pool of backend processors handle processing

UMassAmherst CS677: Distributed OS Lecture 1, page 17

Distributed System Models (contd)

- Cluster computing systems / Data centers
 - LAN with a cluster of servers + storage
 - Linux, Mosix, ..
 - Used by distributed web servers, scientific applications, enterprise applications
- Grid computing systems
 - Cluster of machines connected over a WAN
 - SETI @ home
- WAN-based clusters / distributed data centers
 - Google, Amazon, ...
- Virtualization and data center
- Cloud Computing

Emerging Models

- Distributed Pervasive Systems
 - "smaller" nodes with networking capabilities
 - Computing is "everywhere"
 - Home networks: TiVO, Windows Media Center, ...
 - Mobile computing: smart phones, iPODs, Car-based PCs
 - Sensor networks
 - Health-care: personal area networks
 - Sustainability as a design goal

UMassAmherst CS677: Distributed OS Lecture 1, page 19

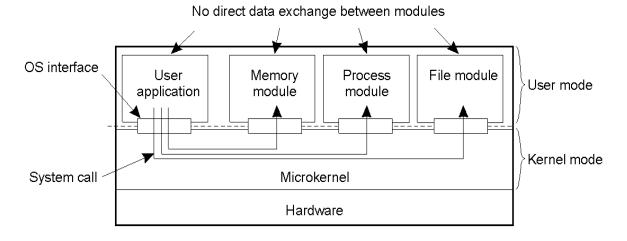

Uniprocessor Operating Systems

- An OS acts as a resource manager or an arbitrator
 - Manages CPU, I/O devices, memory
- OS provides a virtual interface that is easier to use than hardware
- Structure of uniprocessor operating systems
 - Monolithic (e.g., MS-DOS, early UNIX)
 - One large kernel that handles everything
 - Layered design
 - Functionality is decomposed into N layers
 - Each layer uses services of layer N-1 and implements new service(s) for layer N+1

Microkernel Operating Systems

Microkernel architecture

- Small kernel
- user-level servers implement additional functionality

UMassAmherst CS677: Distributed OS Lecture 1, page 21

Distributed Operating System

- Manages resources in a distributed system
 - Seamlessly and transparently to the user
- Looks to the user like a centralized OS
 - But operates on multiple independent CPUs
- Provides transparency
 - Location, migration, concurrency, replication,...
- Presents users with a virtual uniprocessor

Types of Distributed OSs

System	Description	Main Goal
DOS	Tightly-coupled operating system for multi- processors and homogeneous multicomputers	Hide and manage hardware resources
NOS	Loosely-coupled operating system for heterogeneous multicomputers (LAN and WAN)	Offer local services to remote clients
Middleware	Additional layer atop of NOS implementing general- purpose services	Provide distribution transparency

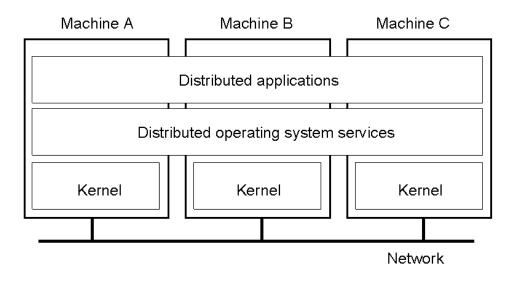

UMassAmherst CS677: Distributed OS Lecture 1, page 23

Multiprocessor Operating Systems

- Like a uniprocessor operating system
- Manages multiple CPUs transparently to the user
- Each processor has its own hardware cache
 - Maintain consistency of cached data

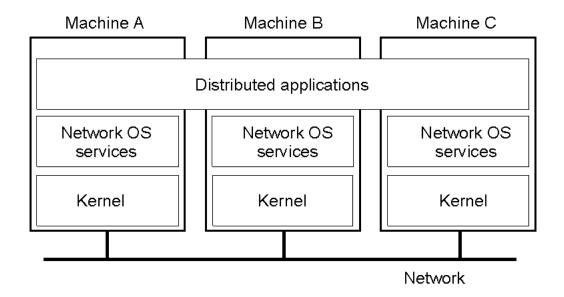

Multicomputer Operating Systems

Example: MOSIX cluster - single system image

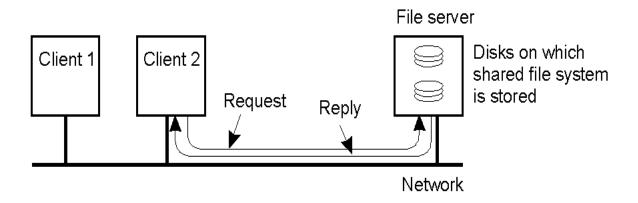

UMassAmherst CS677: Distributed OS Lecture 1, page 25

Network Operating System

Network Operating System

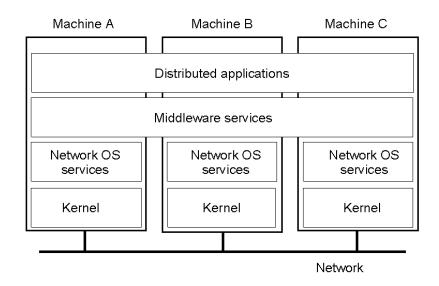

- Employs a client-server model
 - Minimal OS kernel
 - Additional functionality as user processes

UMassAmherst CS677: Distributed OS Lecture 1, page 27

Middleware-based Systems

• General structure of a distributed system as middleware.

Comparison between Systems

Th	Distributed OS			Middleware-	
Item	Multiproc.	Multicomp.	Network OS	based OS	
Degree of transparency	Very High	High	Low	High	
Same OS on all nodes	Yes	Yes	No	No	
Number of copies of OS	1	N	N	N	
Basis for communication	Shared memory	Messages	Files	Model specific	
Resource management	Global, central	Global, distributed	Per node	Per node	
Scalability	No	Moderately	Yes	Varies	
Openness	Depends on OS	Depends on OS	Open	Open
